

Indoor air pollution hits EPA too close to home

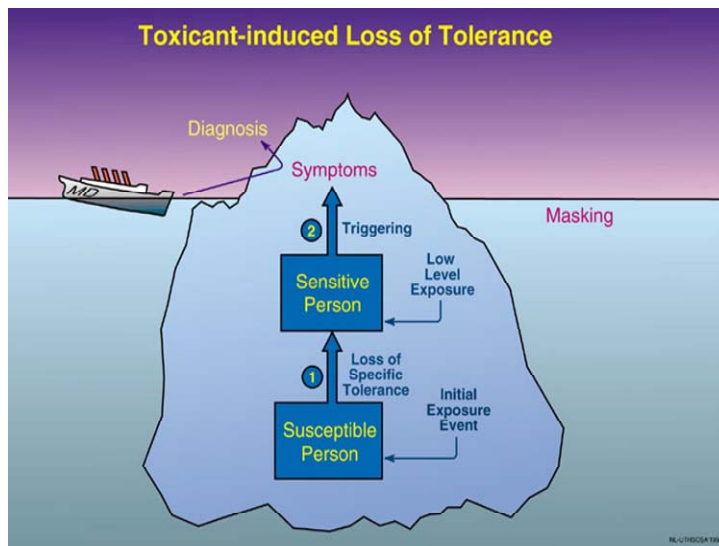

By Aaron Epstein
Knight-Ridder News Service

Washington – The pollution experts at the Environmental Protection Agency should know a sick building when they see it. They work in one.

Yet, despite all their expertise and expenditures, they have not yet found a cure.

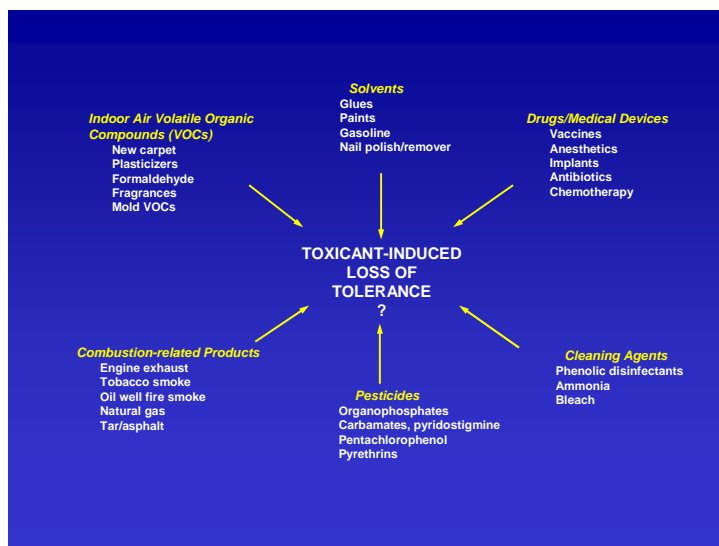

tified. “The EPA won’t publicly say so, but we definitely have Sick Building Syndrome right here.”

Sick Building Syndrome, or SBS, is an unscientific term used to describe a pattern of health symptoms linked to poor indoor air quality in workplaces, schools, homes and other buildings – but difficult to trace to any particular source. It is believed to be the cause

Evidence for Toxicant-induced Loss of Tolerance

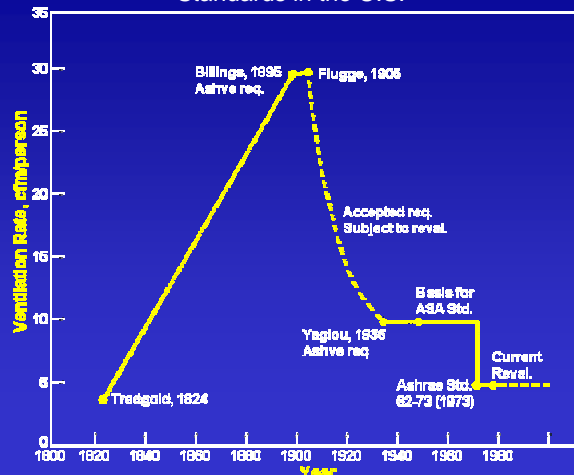

- Similar reports in different regions/countries
- Complaints of new intolerances for foods, alcoholic drinks, caffeine, and medications, *not only* chemicals
- Resemblance to addiction
- Plausible anatomic locus
- Recent animal models

- | | |
|----------------------------------|----------------------|
| Nail polish remover | Perfumes |
| New carpeting | Cigarette smoke |
| Detergent aisle in grocery store | Diesel exhaust |
| Insecticides | Asphalt or tar |
| Fresh newspaper/newsprint | Restroom deodorizers |
| Felt-tip dry marking pen | Particle board |
| Poorly ventilated meeting room | Traffic exhaust |
| New automobile interior | Cigar smoke |
| Fabric stores | Hairspray |
| Hotel rooms | Fresh paint |

Addiction and Chemical Intolerance: A Shared Etiology?

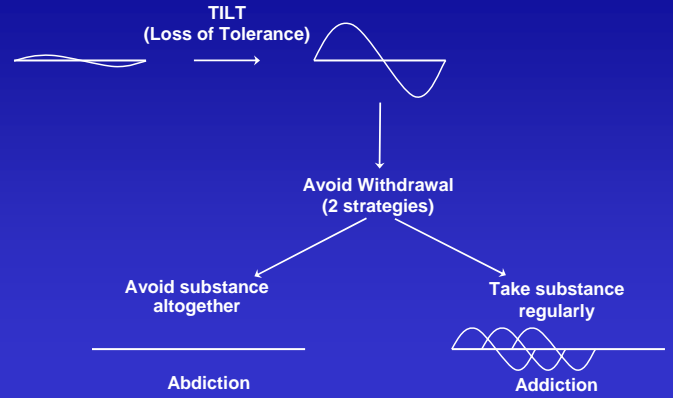

Masking

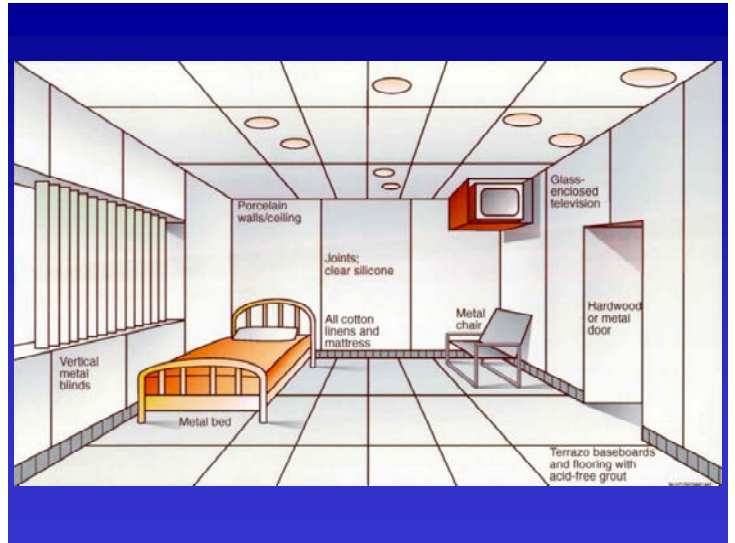

Masking: Apposition

Relationship between TILT, Addiction and Abdiction

Chemical Intolerance: Postulates

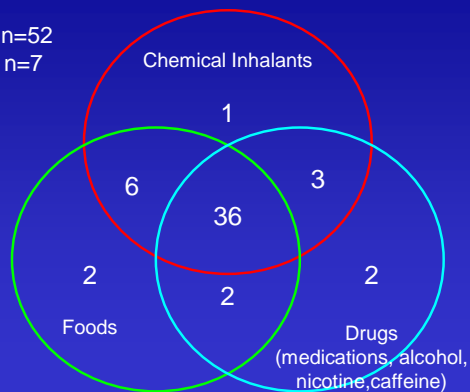

Frequency of New-onset Intolerances Reported by the First 59 Consecutive Gulf War Veterans Seen at the Houston VA Regional Referral Center

Chemical Inhalants	78%
Medications	40% of those who took drugs
Alcoholic beverages	66% of alcohol users
Caffeine	25% of caffeine users
Foods	78%
Specific foods	64%
Illness after meals	49%
Tobacco use	74% of tobacco users

New-Onset Intolerances Reported by 59 Consecutive Gulf Veterans

Intolerances n=52
No Intolerances n=7

Frequency of "Severe" Symptoms Among Three Exposure Groups versus Controls (%)

Symptom	Gulf War Veterans n=59	Pesticide-Exposed n=37	Remodeling-Exposed n=75	Controls N=112
Fatigue	78	68	52	3
Depression	29	49	33	6
Headaches	53	38	31	5
Shortness of breath	38	43	31	2
Asthma or wheezing	12	27	15	0

Chemical Intolerance – Genotypes

- Canadian case control study to determine whether chemically intolerant individuals differ from controls for genetic polymorphisms in drug-metabolizing enzymes
- Caucasian female cases (203) and controls (162)
- CYP2D6, NAT1, NAT2, PON1, PON2, MTHFR were genotyped
- Significant difference found in cases vs. controls for CYP2D6 ($p=0.02$)
- OR CYP2D6 homozygous active=3.36 ($p=0.01$)
- OR NAT2 rapid metabolizer=4.14 ($p=0.01$)

Source: McKeown-Essen et al, Int J Epidemiol 2004; 33:1-8

Chemical Intolerance – Genotypes

- CYP2D6 metabolizes centrally acting drugs and toxins such as tricyclic antidepressants, selective serotonin re-uptake inhibitors, monoamine oxidase inhibitors, amphetamines, codeine, neuroleptics, neurotoxins, and endogenous neurotransmitters
- Latter finding may be relevant to observations that poor metabolizers score higher on anxiety scales and lower on socialization scales
- NAT2 expresses arylamine transferase which determines susceptibility to aromatic amines

Source: McKeown-Essen et al, Int J Epidemiol 2004; 33:1-8

Chemical Intolerance – Genotypes

- Cases were more likely to be heterozygous for PON1-55 (OR=2.05, $p=0.04$) and PON1-192 (OR=1.57, $p=0.04$)
- PON genes have been linked to Gulf War veterans' illnesses (Haley et al., 1999)
- *Post hoc* analysis showed significant effect of being a rapid metabolizer for both NAT2 and CYP2D6: OR for rapid/rapid vs. slow/slow combination of CYP2D6 and NAT2 was 18.7
- Conclusion: chemically intolerant individuals differ from controls for genetic polymorphisms in enzymes that metabolize drugs/toxins/endogenous neurotransmitters

QEESI
Quick Environmental Exposure and Sensitivity Inventory V-1

The purpose of this questionnaire is to help identify health problems you may be having and to understand your responses to various exposures. Complete pages 1-5, describing how you are now. Then fill in the "target" diagram below.

If your health problems began suddenly or became much worse after a particular exposure event, such as a pesticide exposure or moving to a new home or office building, then go back through pages 1-5 and indicate how you were before the exposure event. Use different colors or symbols (circles, squares) for "before" and "after" scores by using different colors or dashed versus solid lines.

Symptom Star

Instructions: Open page 3 so that it lies next to this page. Place a dot on the corresponding circle for each symptom item. Connect these points between "before" and "after" scores by using different colors or dashed versus solid lines.

High validity, reliability

Sensitivity 92%, specificity 95%

Symptom scale derived by factor analysis

"Symptom star"

(Miller and Prihoda, *Tox Industr Health* 15:370-385, 1999)

Theories of Disease

Theories of disease are our attempt to explain what is going on inside a "host" by postulating a general mechanism

A "theory of disease" is a yet-to-be proven general mechanism for a class of disease

Germ Theory of Disease

1. Many different kinds of germs cause response
2. Many different responses involving any and every organ system
3. Specific mechanisms may vary greatly (cholera vs. AIDS vs. shingles)
4. No single biomarker. Identification of specific germs took years
5. Prevention—avoidance, antiseptics, sanitation, use of gloves—preceded our knowledge of specific mechanisms

Immune Theory of Disease

1. Many different kinds of antigens cause response
2. Many different responses involving any and every organ system
3. Specific mechanisms vary greatly (poison ivy vs. allergic rhinitis vs. serum sickness)
4. No single biomarker, identification of specific antibodies took years
5. Prevention—avoidance, allergy shots—preceded our knowledge of specific mechanisms

Toxicant-induced Loss of Tolerance

Diagnosis

Symptoms

2 Triggering

Sensitive Person

Low Level Exposure

1 Loss of Specific Tolerance

Susceptible Person

Initial Exposure Event

Masking

TILT Theory of Disease

1. Many different kinds of chemicals cause response
2. Many different responses involving any and every organ system
3. Specific mechanisms may vary greatly
4. Currently no biomarker
5. Prevention—avoidance—may precede our knowledge of specific mechanisms

The 7 A's

- Asthma
- Autoimmune diseases
- Affective disorder
- Attention deficit/hyperactivity disorders
- Autism spectrum disorders
- Allergies
- Addiction (masking)

What is plausible depends upon the biological knowledge of the time.
